# Part I

# Goal

#### GitHub Organization: www.github.com/StringhiniLab

The goal of this manual is to provide the **minimum necessary guidelines** for new members of Dr. Silvia Stringhini's lab to follow agreed-upon practices in code management.

#### Introduction

The use of programming languages has become an essential part of data analysis for most researchers today. In this context, a basic skill set in computer science is key to ensuring reliable and reproducible results (Wilson et al. 2017; Hicks 2023; Abdill, Talarico, and Grieneisen 2024). Although a variety of educational materials, tutorials, and recommended practices specifically designed to train researchers are available (The Carpentries; Our Coding Club; The Turing Way Community 2023; CodeRefinery Project), there is a trade-off: adopting and practicing these techniques often requires significant effort, taking time away from researchers' primary fields of study (Allen and Mehler 2019; Goldsmith et al. 2021; Hicks 2023).

One consequence of the deficiency in training is the uncertainty researchers may have about how to write code correctly, which negatively impacts their willingness to share their analyses (Gomes et al. 2022). Thus, this results in a decrease in the number of publications with available code, impacting the reproducibility and transparency of scientific research (Gomes et al. 2022; Sharma et al. 2024). This issue is exacerbated by the lack of incentives from the scientific system, leading to a high number of publications where authors do not share their code, despite the benefits of making their code open source (Allen and Mehler 2019; Melvin et al. 2022; Bertram et al. 2023; Tazare et al. 2024; Xu et al. 2025).

Encouraging researchers to actively adopting best practices and seek training in the use of computational tools that facilitate or enhance their work is desirable and should be promoted. However, leaving code management decisions entirely in their hands could have negative consequences for a research group.

#### Ten reasons to define code management practices from day one

Would the problem be solved if future new members of the lab arrived with better training in data science? No. We believe the research group should still define its priorities when it comes to managing code.

There are several benefits to defining clear minimum guidelines and basic computational skills from the moment new members join the lab:

#### 1. Avoid messy projects from the start.

Centralizing data analyses on a GitHub Organization and creating standards for pushing

code promotes improved repository structuring, version control, and better-documented code, ensuring reproducibility from the project's inception.

2. Implement minimum documentation and project management best practices. Defining group-level criteria for code and data management facilitates collaboration, saving time and avoiding errors.

#### 3. Focus on domain-specific skills first.

Identifying domain-specific computational skills can save time for new researchers. This knowledge is sometimes shared in publications tailored to each discipline but is too specific to be addressed by general training courses and tutorials for scientists, being the only exception we know Data Carpentry (Data Carpentry 2024).

#### 4. Early peer review.

Sharing analyses with team members in private repositories allows for valuable feedback. Although initially restricted, this practice fosters confidence in making code publicly accessible upon publication.

#### 5. Define a set of practices that should not be overlooked.

Not all researchers who take a course in Git and GitHub will make their code available if there are no guidelines on whether it is expected of them to do it or not and how. Failing to define certain guidelines will result in each researcher adopting these practices in varying degrees.

6. More efficient use of time. Taking a workshop on a computational tool may occur at an advanced stage of the project. As a result, decisions about code organization, documentation, and file structure could have been made more effectively from the beginning, saving valuable time.

#### 7. Maintain the group's research history.

This approach helps create and standardize a historical archive of the group's data analyses, ensuring continuity and avoiding dependence on researchers leaving behind their code and data when they move on.

8. Facilitate exchange of ideas about data and code management among team members. Creating guidelines helps build a body of knowledge that can be improved over time with contributions from students/researchers, allowing for discussions on which practices should be added, prioritized and/or removed.

#### 9. Make informed decisions about what to learn next.

A researcher may hear that they should learn to use GitHub. By explaining from the beginning what GitHub is and the minimum knowledge required, it becomes easier for them to assess if they should focus on learning additional skills or not. Supporting new members of the research group in adopting basic computational techniques from the start lowers the barrier for researchers to explore other tools early.

10. Adoption of open science practices. If the group aims to begin making research code available, these guidelines and training will effectively promote leaving the code open source.

## i How to cite this book?

# What are the lab's basic guidelines for data and code usage?

## Who are we, and what do we need?

Dr. Silvia Stringhini is an epidemiologist with an extensive career. She has served as the Head of the Unit of Population Epidemiology at the Geneva University Hospitals. Her main research areas include social inequalities in chronic diseases and aging, the role of health behaviors in the genesis of social health inequalities, the biological consequences of social inequalities, and the role of environmental factors in social health disparities.

Recently, she moved her lab to the School of Population and Public Health at the University of British Columbia in Canada, where she is establishing a new team. She is in the process of welcoming new students and staff, making this an ideal time to outline how her new group will manage data and code in its publications.

We discussed with Dr. Stringhini the minimal requirements regarding code management that someone joining the lab should learn. A summary of the agreements reached and how they influenced the creation of this manual can be found in Table 1. Many of these requirements focus on creating a GitHub Organization for the lab.

#### i Definitions: Git, GitHub and GitHub Organization

Git is a tool that helps you track changes to your files, like a digital history of your work.

**GitHub** is an online platform that uses Git to store files and manage changes, collaborate with others, and manage your code in a centralized location. It's like having a shared folder with built-in tools to see what's been changed and by whom. Each project can be stored in its own **repository**.

A **GitHub organization** is a group on GitHub that allows teams to collaborate and manage repositories together.

Table 1: **Book content overview.** This table presents the benefits and selected topics included in the book to guide the team on each prioritized action.

Action	Benefit	What does this book cover?
Centralize the data analysis of the group in a GitHub organization	Preserve copies of the group's data analyses	- Steps to create a GitHub account and be added to the lab's organization - How to create a GitHub repository
Avoid sending confidential data to GitHub	Protection of sensitive data	- Use of .gitignore - Project structure recommendations including how to organize the data folder
Select R as the primary programming language and RStudio as the IDE	Standardize the software used in the lab	- Installation instructions - Recommendations on learning resources and good practices
Share a copy of each lab member's analyses in a private GitHub repository	- Create an initial version of the project that is organized and minimally documented so another lab member can understand it - Foster the habit of performing code backups - Receive feedback from colleagues early in the project development - Have access to analyses from other lab members that have not been published	- How to create a private GitHub repository and what information to include - Basic information to include in the <b>README</b> - Creating a GitHub team and defining procedures to manage access to private repositories - Develop a basic workflow for everyday use of Git and GitHub.
Store the code associated with scientific publications publicly in a GitHub repository	The benefits of leaving code open source Bertram et al. (2023).	This section will be developed at the time of the first paper's publication

Additionally, considering the lab's long-term evolution, onboarding and offboarding procedures were defined.

## Justification

We recognize that creating the code for a scientific publication takes time and involves numerous attempts before deciding what figures and results effectively will be published. Keeping this in mind, it was decided that each student would generate a **private GitHub repository** by project to maintain a backup of daily data analyses conducted in the lab. This private repository could then serve as the foundation for a public version for the final GitHub repository with the scientific article's code. Publicly sharing the code and data management process can be more challenging for early-career researchers (Gomes et al. 2022; Tazare et al. 2024).

Maintaining this initial private repository has other benefits in addition to functioning as a backup: it allows sharing the code with other lab members (as part of a GitHub lab team), makes available analyses that may not be included in the final paper but could be relevant for another publication, helps keeping a clearer project structure from the beginning and **improves the overall documentation of the project**.

Characteristics specific to the research area were discussed, including handling sensitive data (Mathur and Fox 2023; The Turing Way Community 2023). As a result, practices like using .gitignore and and creating a data/ folder with raw/ and processed/ sub folders were suggested to prevent private data from being pushed to GitHub and to maintain an orderly system for storing such information within the project. Also, we created a README template designed to be accessible to non-programmers to be sure that the relevant information, as the database version in use and computational environment, is captured.

#### i What is a .gitignore file

A .gitignore file is a special file used in Git repositories to specify which files and directories should be ignored, meaning they won't be tracked or included in version control. This is useful for excluding temporary files, sensitive data, or files that shouldn't be shared with others.

One of the more challenging aspects to adopt is using Git, as it has multiple utilities and a considerable learning curve. Considering this, it was decided that, in this initial stage, **Git and GitHub's** primary use would be to create an online and centralized backup of the projects, share repositories among team members, and manage version control instead of focusing in collaborative tools.

Since R is the most widely used programming language in the discipline, the team decided to leverage the Git integration provided by **RStudio's Git tab** for integrating students' local work into the GitHub repositories.

## i What is the difference between R and RStudio?

 ${\bf R}$  is a programming language and software environment used for statistical computing and data analysis.

**RStudio** is an integrated development environment (IDE) for R, providing a userfriendly interface with tools for writing, editing, and running R code, as well as visualizing data and managing projects.

## References

# **Defining roles**

## GitHub Organization Manager

The Owner of the organization can add new members. Ensure that new lab members join the GitHub Organization. Follow the instructions on how to do it in Inviting users to join your organization.

A You will need to wait for the new member to create a GitHub account before you can add them. They should share their username with you.

#### Responsibilities

• Add new lab members to the GitHub Organization.

## GitHub Team Maintainer

At least one person in the lab will be assigned as the Team Maintainer of the GitHub organization. This role will allow them to add and remove members from the team, granting or revoking access to private repositories.

For this, it's important to assign the Lab Member in charge the **Team Maintainer** role for the Lab Team.

Follow the instructions in Assigning the team maintainer role to a team member

If properly assigned the label maintainer should appear next to their name in this repository: https://github.com/orgs/StringhiniLab/teams/lab-team.

#### Responsibilities

- Add new lab members to the Lab Team.
- Remove team members who are no longer part of the lab.
- Assign other members as Team Maintainers if necessary.

# Part II

# **Practical Steps**

# 1 Onboarding

## Checklist

- $\Box$  Create your personal GitHub account.
- $\Box$  Request access to the GitHub Organization.
- $\hfill\square$  Request access to the Lab Team.
- $\Box$  Install Git, R and RStudio.

## 1.1 Create Your Personal GitHub Account

First, you need to create an account on GitHub by following these steps: Creating an account on GitHub.

After creating your GitHub account, you'll notice that your profile is associated with a specific URL, structured as follows:

• https://github.com/<username>

This page allows you to access your account settings and all repositories you create.

## 1.2 Request Access to the GitHub Organization

Our lab has a GitHub organization that centralizes the repositories for everything produced in the lab.

Notice that the organization's URL is different from your profile's:

• https://github.com/StringhiniLab

To gain access, you need to provide your GitHub username to the person managing the organization. Having access to the organization will enable you to create repositories within it.

**i** Note that you have your personal GitHub url, and also there is the url of the GitHub organization.

#### **1.3 Request Access to the Lab Team**

Not all lab repositories are public. To access repositories owned by other lab members, you must also be added to the Lab Team.

Dr. Stringhini, as the owner of the organization, always has access to all repositories.

- Adding organization members to a team
- Managing team access to an organization repository

#### 1.4 Installation Instructions

To work in the lab, you will need to have Git, R, and RStudio installed.

Please note that the installation process may vary depending on whether you have a computer with Windows, Linux, Mac (Intel chip), or Mac M1, M2 and M3 (Apple Silicon chip) operating systems.

• Git: Download Git

You can read more about options on how to install Git in the book Happy Git and GitHub for the useR (Bryan and Hester 2024)

- R: Download R
- RStudio: Download RStudio

If you want to read some more details about basic use of R and RStudio you can read the preqrequisites section of the book R for Data Science (Wickham and Grolemund 2024)

### ▲ Installation issues

It could happen that you find issues during the installation process. Remember that we are a team and that you can use Slack to share the problem and look for support

## References

# 2 Starting a New Project

These steps only need to be completed once, at the beginning of a project.

## Checklist

 $\Box$  Create a private repository by new project.

- $\Box$  Add the Lab Team to the repository.
- $\hfill\square$  Clone the repository and associate it with an RS tudio Project.
- $\Box$  Add your Data folder to .gitignore.
- $\Box$  Complete the **README** file using the template.
- The most comprehensive book on using Git and GitHub for R users is Happy Git and GitHub for the useR (Bryan and Hester 2024)

## 2.1 Create a private repository by new project

When starting to work on a new project, your first step is to create a **private** repository in the lab's GitHub organization: StringhiniLab GitHub.

1. Click the green **New** button to open a window like this:

#### Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? Import a repository.

Required fields are marked with an asterisk (\*).

Repository template No template Start your repository with a template repository's contents.  Pwner * Repository name *	
StringhiniLab       I         chronic-diseases_private         chronic-diseases_private is available.	
Great repository names are short and memorable. Need inspiration? How about silver-	fiesta ?
Description (optional) Code for analyzing and modeling chronic disease patterns using data from the Canad	dian Longitudinal Stu
Public Anyone on the internet can see this repository. You choose who can commit.	
• Private You choose who can see and commit to this repository.	
Initialize this repository with: Add a README file This is where you can write a long description for your project. <u>Learn more about READMEs.</u>	
Add .gitignore .gitignore template: None Choose which files not to track from a list of templates. <u>Learn more about ignoring files.</u>	
Choose a license License: None -	
A license tells others what they can and can't do with your code. Learn more about licenses.	
This will set $p_{main}$ as the default branch.	
(i) You are creating a private repository in the StringhiniLab organization.	
	Create repository

2. Complete/select using the following criteria:

#### $\Box$ Owner

Select StringhiniLab as the owner, not your personal GitHub account.

#### $\Box$ Repository Name

Choose a name that represents your project. Since this repository will be private, append \_private to the name.

 $For example, if the repository name is \verb|chronic-diseases|, name it \verb|chronic-diseases\_private|.$ 

 $\Box$  Description

Provide a more detailed description of the project here. This helps identify the repository's content in the organization.

- □ **Public or Private?** Ensure the repository is set to **Private**.
- □ Initialize Repository With Add a README.md.

Ignore the other options for now.

If everything works, you'll see your repository within the GitHub organization labeled as Private.

## 2.2 Add the Lab Team to the repository

StringhiniLab / chronic-dis	seases_private ≙			Q Туре 🛛
Code 🕢 Issues Il Pull reques	ts ⊙ Actions ⊞ Projects ① Security இ General Access A Collaborators and teams	Insights  Settings  Who has access  Private repository Only those with access to this repository can view	w it	Manage
	Code and automation <sup>3</sup> Branches C Tags F Rules C Actions S Webhooks	PRIVATE REPOSITORY A BASE ROLE (Write) Only those with access to this repository can view it. Manage	1 user has access to this repository. 1     0 use ouse can a repository. 1	ers and <u>0 teams</u> access this sitory through the nization.
	<ul> <li>Pages</li> <li>Custom properties</li> </ul>	Manage access	Create team Add peopl	le Add teams
	Security          Ocde security         Deploy keys         Secrets and variables       >	Direct access Organization access Select all Q Find people or a tea	т Туре	✓ Role ✓
	Integrations 88 GitHub Apps ⊠ Email notifications	Florencia D'Andrea     fior14		e: admin 🖞

1. Navigate to the repository's Settings tab.

In the left-hand sidebar, find and click on Collaborators and teams.

2. Click Add teams and add Lab Team.

By default, you will select the Read role for the team. The idea is that other Lab Members can view the repository but will not be able to edit it by mistake. Add teams to chronic-diseases\_private

۶	R Lab Team × StringhiniLab/lab-team
Cho	ose a role
۲	Read Recommended for non-code contributors who want to view or discuss your project.
0	<b>Triage</b> Recommended for contributors who need to manage issues and pull requests without write access.
0	Write Recommended for contributors who actively push to your project.
0	Maintain Recommended for project managers who need to manage the repository without access to sensitive or destructive actions.
0	Admin Recommended for people who need full access to the project, including sensitive and destructive actions like managing security or deleting a repository.
	Cancel Add StringhiniLab/lab-team

This allows all current Lab Members to view (but not modify) your project.

If you don't want to share an analysis with other Lab Members, you can create a repository in your personal GitHub account instead. However, **always ensure sensitive data is not pushed to GitHub** for confidentiality reasons.

×

All repositories in StringhiniLab should be accessible to the Lab Team, which is why these repositories are hosted in the organization instead of personal accounts. Remember that individuals who are Owners of the organization can view all repositories even if there are not part of the Team.

## 2.3 Clone the repository and associate it with an RStudio Project

#### **i** Before start using RStudio:

We recommend changing the default option Restore .RData into workspace at startup as explained in this section. (Posit 2024)

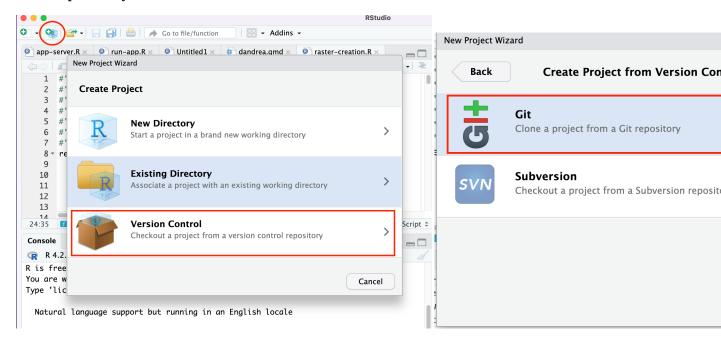

#### 1. Open RStudio

If RStudio is not installed, complete first the installation instructions in the Onboarding section.

#### 2. Clone the Repository

#### In RStudio:

File > New Project > Version Control > Clone a Project from a Git Repository.

Go back to the repository and copy the repository's URL.

And paste it in the correct field:

New Project Wizard		
Back	Clone Git Repository	
	Repository URL:	
	git@github.com:StringhiniLab/chronic-dis	eas
	Project directory name:	
	chronic-diseases_private	
	Create project as subdirectory of:	
	/Users/florenciadandrea	Browse
Open in new se	ssion Create Proje	ect Cancel

If successful, you'll see a folder containing your project, including the **README** file that we created on GitHub, in the **Files** tab at the bottom-right of RStudio.

Note that an .Rproj icon has appeared. Clicking on this icon outside of RStudio will open RStudio directly within the project.

Additionally, the project name now appears in the top-right corner. By opening that menu, you can easily switch between projects without leaving the RStudio IDE.

You'll also notice a tab named Git in the top-right panel.

- **i** Do you want to learn more about the use of RStudio and how to create projects?
  - Check the RStudio IDE User Guide (Posit 2024)
  - Read the Projects section in Chapter 6 of R for Data Science (Wickham and Grolemund 2024)

#### 2.3.1 Add your Data folder to .gitignore

We work with sensitive data. If working locally, create a data folder (e.g., click the + Folder icon in the Files tab). Move your data files into this folder.

Open the .gitignore file and add the line data/. This tells Git to ignore the contents of the data folder, preventing accidental data pushes.

We recommend creating at least two sub-folders within data/:

- raw/: Use this folder to store the original datasets.
- processed/: Use this folder to save any datasets generated as preliminary or final results from your analyses.

If data/ is listed in your .gitignore file, both subfolders will automatically be ignored by Git since they are located within the data/ folder.

If the folder is not in the project root or has a different name, adjust the .gitignore settings accordingly.

Your project structure should look like this:

```
project-folder/
.gitignore # Specifies files and folders to ignore in version control
README.md # Documentation about the project
data/ # Folder to store datasets
    raw/ # Original datasets (never modified directly)
    processed/ # Cleaned and processed datasets
```

#### i What type of document should you use for your data analysis?

There are many files you can use run your code. You can use a basic R script (Wickham and Grolemund 2024), an RMarkdown document or its more current version Quarto. If you're unsure where to start, we recommend using a Quarto Document. A Quarto document, just like RMarkdown, allows you to include code chunks throughout a text and save it as a Word, PDF, or HTML report. Combining text where you explain your reasoning and the details of the analysis with the code chunks makes it much easier to understand each section of code, both for yourself and for other readers.

- To use Quarto, you must first install it
- Tutorial to learn how to create a document with Quarto (Quarto Project 2024)

It's important to note that there is a learning curve for using tools like Quarto. Creating a simple R script might be a good enough option if you're looking to start your analysis more straightforwardly.

We encourage you to discuss this on the lab Slack to hear the experiences of other researchers. If any consensus emerges, feel free to open a New Issue here to improve this guide.

and you .gitignore file should look like this:

.Rproj.user .Rhistory .RData .Ruserdata data/

## 2.4 Complete the README using the template

Before starting work, fill out the README.md file with the following information:

```
# Title
## Author
**Name:** [Your Name]
**Email:** [Your Name]
## Start Date
```

```
[YYYY-MM-DD]
## Objective
The objective of this project is to ...
## Database Used and Version
**Database Name:** [Name]
**Data Version:** [Specify version or date accessed]
-[] Sensitive data is stored locally and excluded from version control using `.gitignore.`
-[] All analyses comply with the data use agreements.
## Project Structure
chronic-diseases/
  data/ # Folder for datasets
    raw/ # Original datasets (never modified directly)
    processed/ # Cleaned and processed datasets
  scripts/ # R scripts for analysis
  outputs/ # Figures, tables, and other results
  README.md # Project overview and documentation
   .Rproj # RStudio project file
## Reproducibility
Run `sessionInfo()` in the console and paste the output between the two lines with backticks
. . .
. . .
```

There is more material available on organizing project structures (Eugene Barsky 2024), using .gitignore (The Turing Way Community 2023) or other resources listed here, or creating good README files (The Turing Way Community 2023) and name conventions (Eugene Barsky 2024) if you want to explore further.

Additionally, UBC Library offers some basic data management courses that might be helpful to you: Short courses (Eugene Barsky 2024)

# **3 Regular Project Workflow**

These steps should be completed every day you work on the project. Although they may seem complex at first, once you get accustomed to them, you won't need to think about it anymore.

## Checklist

- $\Box$  Add all the files you want to commit to the staging area.
- $\Box$  Create a commit message.
- $\Box$  Push the changes to the GitHub repository.

## 3.1 How to use the Git tab in RStudio

#### 🛕 Why GitHub?

Git and GitHub were originally created for professional software development. It's important to clarify that lab members are not expected to be expert users of Git and GitHub, but rather to handle basic commands necessary to achieve the use proposed.

Pay attention to the Git tab located in the top-right corner. Git will only display files that have been added, modified, or deleted since the project was initialized or since the last commit (we'll cover what that means shortly).

Keep in mind that when we cloned the project from GitHub, two new files were added:

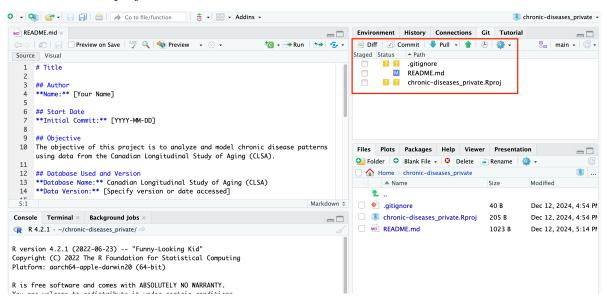

• The .Rproj file, created because we based our RStudio project on the repository.

• The .gitignore file, automatically generated as part of the project setup in RStudio.

These files will appear with a yellow question mark, indicating they are *untracked*—in other words, Git is aware of them but has not yet saved them under version control.

The README.md file initially did not appear in the Git tab. However, after adding the template and saving the changes, it now shows a blue "M," which indicates that the file has been *modified*.

If you were to remove a file, you would see it next to a red 'D', indicating that it has been *deleted* from the project.

The next step is to save these changes in the project and add a descriptive title. Each time you save a new version of the project, we say you are making a commit, which you label with a title.

#### 3.1.1 Add all the files you want to commit to the staging area.

The first thing you need to do is check in the Staged section of the Git tab all the changes you want to save under the same title. You will notice that sometimes a green 'A' appears. You can ignore this. The important part is that you check all the changes you want to save.

In our case, since we are working with non-collaborative repositories and the main purpose of using GitHub is to share data with other coworkers and maintain a backup. If at any point you need to learn more, at the end of this page, there are some recommended materials that might be helpful.

Enviro	nment	History	Connections	Git	Tutorial			
🗏 Diff		ommit	🖊 Pull 🖌 🚹		🌼 <del>-</del>	👼 🛛 main 🖌 📿 🗸

$\checkmark$	Α	A .gitignore						
<ul> <li>Image: A start of the start of</li></ul>	М	M README.md						
$\checkmark$	A chronic-diseases_private.Rproj							

#### 3.1.2 Create a commit message.

After doing this, you need to click the commit button to make these changes permanent in the project. You will then choose a message for the commit and click the Commit button.

		RSt	udio: Revi	ew Changes	
	Chan	ges History main 🖌 🕝 🗹 Stage 🛛 🄄 Revert 🚳	Ignore	•	Pull 🔒 Push
Sta	ged	Status A Path		Commit message	49 characters
_	<ul> <li>Image: A start of the start of</li></ul>	A .gitignore		Add README template and RStudio project s	tructure
	<b>~</b>	M README.md	_		
		chronic-diseases_private.Rproj		Amend previous commit	Commit
Sł	ow	● Staged ○ Unstaged Context 5 lines ✓ □ Ig	gnore Whit	tespace 🔄 Unstage All	
		@@ -1,2 +1,35 @@			Unstage chunk
1		<pre># chronic-diseases_private</pre>			
2		Code for analyzing and modeling chronic dis Study of Aging (CLSA)	sease p	atterns using data from the Canadian Longi	tudinal
	1	# Title			
	2				
	3	## Author			
	4	**Name:** [Your Name]			
	5				

## **?** How often should you commit?

Think of commits as checkpoints for related changes. If you might want to revert a set of changes later, commit them together.

## 3.2 Push the changes to the GitHub repository.

Finally, to push the changes to GitHub, click the Push button.

Enviro	onment	History	Connections	Git	Tutorial	
🗏 Dif	f 🛛 🗹 Co	mmit	🖣 Pull 🖌 👔	$\checkmark$	🍄 -	🎝 main 🗸 📿 🗸
🚺 Υοι	ur branch is	s ahead o	f 'origin/main' by	/ 1 cor	nmit.	
Staged	Status	🔺 Path				

You'll notice that the files in the Git tab disappear after you commit. This is expected, as Git only tracks changes between commits. Remember, if you don't click the green arrow representing push, the changes will not take effect on GitHub.

If everything went smoothly, you should navigate to the repository URL and see the changes you made.

How often should you push? Push your changes at least once a day after completing your work.

## 3.3 Moving foward with Git and GitHub

If you want to learn more about Git and GitHub, we recommend the following books and tutorials:

#### Books

0

- Happy Git and GitHub for the useR book (Bryan and Hester 2024)
- Chapter 12 Collaboration with version control from the book Data Science: A First Introduction (Timbers, Campbell, and Lee 2022)
- The Turing Way Handbook: Git for research projects (The Turing Way Community 2023)

#### Tutorials

- Software Carpentry: Version Control with Git (Gonzalez et al. 2019)
- Setting up a GitHub Repository for Your Lab Version Control and Code Management with GitHub (Our Coding Club)
- Code Refinery Introduction to version control with Git (CodeRefinery Project)

## References

## 4 Offboarding

• The Lab Member must be removed from the GitHub Lab Team.

When leaving the organization, you will lose access to private repositories created by other team members but will retain access to those you created yourself.
